This curious little book is basically a hitchhiker s guide to Book I of Euclid s Elements. We travel through each of the forty-eight Propositions--more or less in order--and see how each one generalizes--or does not generalize--to hyperbolic and other non-Euclidean spaces. Few people seem to realize that Einstein s special theory of relativity is a model of hyperbolic geometry. The connection between Minkowski geometry and special relativity is well-known, while the connection between hyperbolic geometry and special relativity is, rather, known of. But this book makes the hyperbolic connection explicit; PoincareA disks rather than the traditional Minkowski diagrams are used to illustrate concepts of special relativity. As we progress through Euclid s propositions, it becomes increasingly clear that every theorem in neutral and hyperbolic geometry can be translated into a true statement in special relativity.
