PENNSYLVANIA GEOLOGY SUMMARIZED (CLASSIC REPRINT) (HARDBACK)

Forgotten Books, 2017. Hardback. Condition: New. Language: English . Brand New Book ***** Print on Demand *****.Excerpt from Pennsylvania Geology Summarized Books are of three great classes or groups distinguished according to their mode of origin. They vary greatly in physical and chemical character We have been familiar from childhood with stories of volcanic eruptions in which stream of melted rock called lava flow from crater-topped mountains, bringing desolation to any living thing in their courses. Cold, solidified lava exemplifies a large and diverse group of rocks which have similarly cooled and solidified from a molten, fluid, hot state. This group includes such well known examples as granite, some of the trap rocks of commerce, and pumice stone. Because such rocks are fire-born they are called igneous rocks. Igneous rocks are usually even grained with little or no banding of their crystalline, mineral constituents. When the minerals that compose them can be seen, we find them scattered helterskelter through the rocks. But even the hardest granite may weather to sand and mud. We may see this process going on in ledges exposed to the wind and the rain, the frosts of winter and summer suns. This mud and sand, transported elsewhere, become sediments. When laid down in the beds of streams or lakes or the ocean bottom these sediments may in time be hardened into sedimentary rocks. The sedimentary rocks are the second great class. They are usually recognized by their bedded or stratified habit, each bed commonly composed of grains derived from older, broken-up rock: There are many kinds of sedimentary rocks; we need mention only four: (1) shale, indurated (hardened) mud, (2) sandstone made up of cemented sand grains.
