The KNE solids exhibit large mechanical hysteresis due to the reproducible growth and shrinkage of incipient kink bands (IKBs). IKBs are the precursor of regular kink bands. The stress-strain curves of KNE solids can be described by 4 parameters. In this book a microscale model based on fully reversible dislocation motion is proposed to relate the four parameters. A mathematical method based on Preisach-Mayergoyz model (P-M model) was also developed to calculate the strain of KNE solids from their stress history. Select MAX phases (Ti₃SiC₂, Ti₂AlC and some of their solids solutions) and the hexagonal metals (Ti, Mg, Co) were tested. Their kinking nonlinear elastic deformations were studied as a function of grains size, porosity, deformation history and texture. IKB theory successfully explains the damping, microyielding and initial deformation of hexagonal metals, which are not fully understood or misunderstood for a long time. Based on this work there is little doubt that incipient kink bands constitute the last piece in the deformation-of-solids puzzle. This item ships from multiple locations. Your book may arrive from Roseburg,OR, La Vergne,TN. Paperback.
