OCLC Number: 55129170 Excerpt: . . . 1. 2. 1 Current Problems in Gallium Distribution It is well known that the addition of gallium to the CIS structure opens up the bandgap and increases the V of the resulting cell. At ISET, past OC efficiency and spectral response results had indicated that in spite of adding Ga to the absorber layer, we were not getting the full benefit of it in increasing the open circuit voltage. SIMS measurements on our samples had indicated that during the conversion process in which the Cu-In-Ga alloy was converted to CIGS, the gallium is accumulating at the rear of the absorber layer nearing the Mo interface (Figure 1) due to the kinetics of the selenization step. Consequently, controlled stoichiometries, which introduce gallium nearly molecularly in our ink based deposition appears to be ineffectual at opening up the bandgap of the semiconductor. We are countering the problem of gallium depth-distribution by exploring modification routes. Gallium surface treatments will help us achieve higher cell efficiencies by opening up the material bandgap from otherwise CIS-type laboratory cells during the selenization of...

Reviews

These kinds of pdf is the ideal ebook accessible. Of course, it is actually play, nevertheless an interesting and amazing literature. I realized this publication from my i and dad suggested this book to find out.
