*This pdf is definitely not easy to get started on studying but quite entertaining to read through. I am quite late in start reading this one, but better then never. Once you begin to read the book, it is extremely difficult to leave it before concluding.*

Not illustrated. 1907 Excerpt: .bronchopneumonia, or gangrene, but in which the infecting agent is a species of streptothrix different from the cattle variety. About 30 cases of this kind have been reported (1900). Different species have been described, such as the Streptothrix eppingeri (Cladothrix asteroida), Streptothrix pseudotuberculosis, Flexner; Streptothrix hominis, Foulerton, and Streptothrix israeli. The organism is found in the sputum, often in the form of small, grayish-yellow granules. These are made up of a mycelium of branching organisms, which in the unstained specimen appear as fine, homogeneous, glistening threads, about two to four times as wide as a tubercle bacillus. They are acid fast, but can be decolorized with 1 R. Paltauf, Sitzungsber. d. K. K. Gesellsch. d. Aerzte Wien, 1880. alcohol. In such specimens many of the threads present a beaded appearance and sometimes seem to be breaking up into short rods of varying length. With Gram some varieties stain well, while others do less so. Culture yields uncertain results. Flexner obtained no growth. Eppinger succeeded with gelatin, inspissated horse serum, maltose agar, and potato. Literature.--Ashton and Morris, Jour. Amer. Med.
